Overview

This document provides some elementary examples of the XML / SOAP transactions for the most commonly used formats for the XML interfaces.

These samples will NOT work exactly as are, you may need to change such things as;

- a) user name,
- b) password,
- c) Schema Name and version ,

In order to match the exact settings of your XML file details.

These files are designed to provide an indicative structure for your benefit, and are not intended to be used as a working test for software.

In order to test, developers should be using the staging server, including allocated test tags, properties and will need to have their accounts authorised by the NLIS Database Help Desk.

For any further queries, please contact Grant Carlson via email at gcarlson@mla.com.au.

NVD Add Generic Waybill Upload

The NVD Generic Waybill Upload will allow data to be added, , using the same XML format. If the NVD serial number does not exist in the same upload, the data and image will be added. If the NVD serial number already exists in the same upload system will reject the new data. In a nutshell same NVD serial number is accepted in different uploads but one upload can only contain one NVD serial number.
